

Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) Device for feeding educts to parallel spaces separated from one another comprising a distributor unit, an outlet arrangement of the distributor unit operatively assigned to the parallel spaces, and evaporator structures for the evaporation of liquid media provided in the spaces, wherein the outlet arrangement projects into the spaces, and [[means is provided for ensuring]] the distributor unit is configured such that, at each point of the distributor unit, a boiling point of the liquid medium remains above an actual temperature of the medium in the distributor unit.

2. (Currently Amended) Device for feeding educts to parallel spaces separated from one another comprising a distributor unit, an outlet arrangement of the distributor unit operatively assigned to the parallel spaces, and evaporator structures for the evaporation of liquid media provided in the spaces, wherein the outlet arrangement projects into the spaces, and, at each point of the distributor unit, a boiling point T_s of the liquid medium is above an actual temperature of the medium in the distributor unit, wherein the distributor unit is configured [[in]]

such that flow resistance or pressure loss in the distributor unit varies as a function of a temperature profile along the distributor unit.

3. (Currently Amended) Device for feeding educts to parallel spaces separated from one another comprising a distributor unit, an outlet arrangement of the distributor unit operatively assigned to the parallel spaces, and evaporator structures for the evaporation of liquid media provided in the spaces, wherein the outlet arrangement projects into the spaces, and, at each point of the distributor unit, a boiling point T_s of the liquid medium is above an actual temperature of the medium in the distributor unit, wherein the distributor ~~[[and]]~~ unit is configured such that flow resistance or pressure loss therein rises in proportion to the temperature of the distributor unit.

4. (Previously Presented) Device according to Claim 1, wherein at least a last stage of the distributor has a flow resistance sufficiently high that the boiling point of the liquid in the respective outlet arrangement is higher than an ambient temperature of the outlet arrangement in the respective parallel space.

5. (Original) Device according to claim 1, wherein the distribution unit is configured such that the boiling point of the medium is highest at the hottest point of the distributor unit.

6. (Currently Amended) Device according to claim 1, wherein the distributor unit is configured to be thermally uncoupled in relation to the spaces, at least in a region of the outlet arrangement [[means]].

7. (Previously Presented) Device according to claim 1, wherein the distributor unit is configured to be cooled in relation to the spaces.

8. (Original) Device according to claim 1, wherein the distributor unit is configured such that the liquid medium is feedable to a plurality of spaces via a common feed unit.

9. (Original) Device according to claim 1, wherein the distributor unit comprises at least one distributor stage, via which the liquid medium is distributable into the spaces from a common feed unit.

10. (Currently Amended) Device according to claim 1, wherein the distributor unit is configured such that the flow resistance of a last stage thereof is higher by at least a factor of three than a flow resistance of the distributor unit upstream of the last stage.

11. (Original) Device according to claim 4, wherein the distributor unit is configured such that the flow resistance between different outlets of the last stage

deviates by at most almost 20% from an average value of the flow resistance of the outlet arrangement.

12. (Currently Amended) Device according to claim 4, wherein to generate the higher flow resistance, the distributor unit includes structure effecting a pressure loss, which structures is selected from at least one of [[the]] capillaries, duct structures, meander structures, and sintered porous materials.

13. (Original) Device according to claim 1, wherein the distributor unit is configured such that flow resistance is higher in the outlet means than in downstream spaces of the device.

14. (Original) Device according to claim 1, wherein the distributor unit is configured such that thermally insulating structure is arranged at least regionally around the distributor unit.

15. (Original) Device according to claim 1, wherein the spaces are formed by at least one tube, with one outlet of the outlet arrangement arranged to project into a respective tube.

16. (Previously Presented) Method of using the device according to claim 1, comprising arranging the device to act as a plate reactor.

17. (Previously Presented) Method of using the device according to Claim 1, comprising arranging the device to act as an evaporator having a plate-like construction.

18. (Currently Amended) Method of using the device according to claim 1, comprising operatively arranging the device as part of a [[a]] fuel-cell system.
